SIP Call Flow Examples

Status of this Memo

Abstract

This informational document gives examples of SIP (Session Initiation Protocol) call flows for IP telephony. Elements in these call flows include SIP User Agents and Clients, SIP Proxy and Redirect Servers, and Gateways to the PSTN (Public Switch Telephone Network). IP telephony scenarios include SIP Registration, SIP to SIP calling, SIP to Gateway, Gateway to SIP, and Gateway to Gateway via SIP. Call flow diagrams and message details are shown. PSTN telephony protocols are illustrated using ISDN (Integrated Services Digital Network), ANSI ISUP (ISDN User Part), and FGB (Feature Group B) circuit associated signaling. PSTN calls are illustrated using global telephone numbers from the PSTN and private extensions served

on by a PBX (Private Branch Exchange). Example SIP messages used for testing during SIP "bakeoff" events include SIP "torture test" messages, and messages with invalid parameters, methods, and tags.

Table of Contents

1 Overview

The call flows shown in this document were developed in the design of a carrier-class SIP IP Telephony network. They represent an example minimum set of functionality for SIP to be used in IP Telephony applications. The message examples were developed during the SIP interoperability testing "bake-offs."

It is the hope of the authors that this document will be useful for SIP implementors, designers, and protocol researchers alike and will help further the goal of a standard SIP implementation for IP Telephony. It is envisioned that as changes to the standard and additional RFCs are added that this document will reflect those changes and represent the current state of a standard interoperable SIP IP Telephony implementation.

Note that this document is informational, and is not normative on any aspect of SIP or SIP/PSTN interworking.

These call flows are based on the current version 2.0 of SIP in RFC2543[2].

Various PSTN signaling protocols are illustrated in this document: ISDN (Integrated Services Digital Network), ANSI ISUP (ISDN User Part) and FGB (Feature Group B) circuit associated signaling. They were chosen to illustrate the nature of SIP/PSTN interworking - they are not a complete or even representative set. Also, some details and parameters of these PSTN protocols have been omitted. The intent of this document was not to provide a complete and exact mapping of PSTN protocols to SIP. Rather the emphasis is on the SIP signaling, the message interaction, and the modifications to SIP currently proposed to solve IP Telephony issues.

Finally, some example messages are given along with expected behavior of clients and servers.

1.1 General Assumptions

A number of architecture, network, and protocol assumptions underlie the call flows in this document. Note that these assumptions are NOT requirements. They are outlined in this section so that they may be taken into consideration and to aide in the understanding of the call flow examples.

The authentication of SIP User Agents in these example call flows is performed using SIP Digest[2].

No authentication of Gateways is shown, since it is assumed that:
- . Gateways will only accept calls routed through a trusted Proxy.
- . Proxies will perform the Client authentication.

- . The Proxy and the Gateway will authenticate each other using IPSec[3] or some other non-SIP scheme.

The SIP Proxy Server has access to a Location Service and other databases. Information present in the Request-URI and the context (From header) is sufficient to determine to which proxy or gateway the message should be routed. In most cases, a primary and secondary route will be determined in case of Proxy or Gateway failure downstream.

The Proxy Servers in these call flows insert Record-Route headers into requests to ensure that they are in the signaling path for future message exchanges. This allows them to implement features later in the call, which are not shown in these flows.

Gateways receive enough information in the Request-URI field to determine how to route a call, i.e. what trunk group or link to select, what digits to outpulse, etc.

Gateways provide tones (ringing, busy, etc) and announcements to the PSTN side based on SIP response messages, or pass along audio in-band tones (ringing, busy tone, etc.) in an early media stream to the SIP side.

Two types of Gateways are described in this document. The actual names of Gateways will be vendor and implementation specific. However, two catagories are described here since the type of Gateway determines the form of the SIP URL used to identify them. The two types are:

- Network Gateway. This high port count PSTN gateway originates and terminates calls to the PSTN. Its use is shared by many customers. Incoming calls from the PSTN have the From header populated with a SIP URL containing the telephone number from the calling party telephone number, if available. A Network Gateway typically uses carrier protocols such as SS7.

- Enterprise Gateway. This low port count PBX (Private Branch Exchange) gateway has trunks or lines for a single customer or user. Incoming calls from the PBX have the From header populated with a provisionable string which uniquely identifies the customer, trunk group, or carrier. This allows private numbers to be interpreted in their correct context. An Enterprise Gateway typically uses SS7, ISDN, circuit associated signaling, or other PBX interfaces.

The interactions between the Proxy and Gateway can be summarized as follows:

- The SIP Proxy Server performs digit analysis and lookup and locates the correct gateway.

. The SIP Proxy Server performs gateway location based on primary and secondary routing.

Digit handling by the Gateways will be as follows:

. Dialed digits received from a Network or Enterprise Gateway will be put in a SIP URL with a telephone number. The number will either be globalized (e.g. sip:+1-314-555-1111@ngw.wcom.com ;user=phone) or left as a private number (sip:555-6666@wcom.com) Alternatively, the "phone-context" qualifier could be used to interpret the private number. It is defined in the telephony URL document [4].
All Gateways will need to be provisioned to be able to parse the user portion of a Request-URI to determine the customer, trunk group, or circuit referenced. Note that the visual separator "-" is used purely to aid in the readability of the examples; a real gateway would be unlikely to insert visual separators.

. The From header will be populated with a SIP URL with a telephone number if it is Calling Party number (CgPN) from the PSTN. If it is an Enterprise Gateway, a provisionable string which uniquely identifies the customer, trunk group, or carrier will be used in the sip URI (e.g. From: sip:ProvisionableString@gw1.wcom.com;user=phone).

. Note that an alternative to using a SIP URL for telephone numbers is the tel URL[4]. The major difference between using the SIP URL and the tel URL is that the SIP URL is routable in a SIP network (resolves down to an IP address) where the tel URL is not (it just represents digits).

These flows show UDP for transport. TCP could also be used.

1.2 Legend for Message Flows

Dashed lines (---) represent control messages that are mandatory to the call scenario. These control messages can be SIP or PSTN signaling.

Double dashed lines (===) represent media paths between network elements.

Messages with parenthesis around name represent optional control messages.

Messages are identified in the Figures as F1, F2, etc. This references the message details in the table that follows the Figure. Comments in the message details are shown in the following form:

/* Comments. */

1.3 SIP Protocol Assumptions

Except for the following, this call flows document uses the April 1999 version 2.0 of SIP defined by RFC 2543[2]. The following changes/extensions are assumed throughout:

- A Contact header is included with every INVITE message.

- A Contact header is included in every 200 OK Response.

- The 183 Session Progress response message is used in SIP to Gateway and Gateway to Gateway via SIP calling (Sections 4 and 6). The 183 response indicates to the User Agent that a Gateway has been contacted and is trying to complete the call to the PSTN and that one-way early media may be present which gives an indication of the progress of the call. The User Agent will immediately play to the user any RTP media packets received to hear in-band call progress information such as ringtone or busy tone. Note that SDP is not required in the 183 response since the media is uni-directional. See Section 4 for more information.

- A Content-Length header is present in every message, set to zero if there is no message body. The content length calculations assume that each line of SDP ends with both a CR and a LF character.

- The final entry in a Route header is always the Contact information obtained from the INVITE or 200 OK messages.

- In the SDP message bodies, the time field is "t=0 0" It is expected that an actual SDP message body would have a non-zero start timestamp.

- Branch tags inserted by proxies are unique for each request. In this document, they are not due to editing simplications.

- Tags and Call-IDs are also reused for editing purposes.

- Other simplifications have been made for editing purposes. For example, the order of SIP headers is fairly consistent throughout the document. With a few exceptions, the ordering of SIP headers is not significant.

In any discrepency between this document and RFC 2543, follow RFC 2543. This document is informational only.

1.4 Changes to 00 draft

The major changes between this draft and the previous draft are listed below:

- SIP Telephony Service Examples have been removed from the draft. They will be revised using the TRANSFER header in a separate draft.

- Updated draft with RFC2543bis changes including: adding maddr to all Record-Route and Route headers, adding branch tags to Via headers inserted by proxies, added 487 response to CANCEL scenarios.

- Added example of INFO method in 5.1.1.

- Added Session: media to all 183 messages.

- Corrected a number of typos including putting user=phone tags inside <>, fixing Request-URI on PRACK, added missing tags, fixed Request-URIs that did not match To header in initial INVITE.

- Corrected all registrations to have same Call-ID.

1.5 Changes to 01 draft

The major changes between this draft and the previous draft are listed below:

- Added an example of multiple proxy authentication (3.1.3).

- Removed INFO method from 5.1.1. The use of INFO to transport DTMF is controversial.

- Fixed CSeq and Call-ID errors in Section 2.

- Replaced Session: media with Content-Disposition: session

- Added notes about CSeq numbering spaces.

- Fixed maddr in some Route headers.

- Corrected tag handling and Record-Routes in Section 4.

1.6 Changes to 02 draft

The major changes between this draft and previous are listed below:

- The word "Telephony" has been removed from the document title.

- Selected messages have been successfully validated against a SIP parser for accuracy.

- Added word "informational" to Abstract, and added additional wording about this document being informational and not normative.

- Added re-INVITE call flow (T.38 Fax)in 3.1.7.

- Removed SDP from all 183 Session Progress messages since it is not needed. Corrected figures to show early media path as one way.

- Removed PRACK from example 4.1.2 since there is no longer any need for the 183 to be transported reliably since it no longer contains SDP.

- Corrected Call-ID in 3.1.1.

- Corrected domain in WWW-Authenticate and Proxy-Authenticate headers to be a SIP URL.

- Section 7.4 SIP Date corrected to Sat, 01 Dec 2040 16:00:00 GMT

- Section 7.7 Retransmission strategy for unknown method message should be based on BYE not INVITE

- Section 7.10 multiple message element of this test removed as this behaviour is no longer allowed, higher SIP version number part moved into 7.42

- Section 7.18 recommended response changed

- Added Test Messages 7.21 through 7.41

1.7 Changes to the 03 draft

- Replaced Authorization headers with Proxy-Authorization headers

- Fixed Record-Route in example 3.1.3

- Various CSeq and Content-Length corrections

1.8 Changes to the 04 draft

- Removed domain names from Contact headers

- Removed "phone-context" URI parameter.

- Added expires parameter to 200 OK responses to REGISTERs.

- Changed Proxy-Authorization headers in Section 2 to Authorization headers.

2 SIP Registration Services

2.1 Success Scenarios

Registration either validates or invalidates a SIP client for user services provided by a SIP server. Additionally, the client provides one or more contact locations to the SIP server with the registration request. Registration is used by a Proxy to route incoming calls in an IP Telephony network. Registration are shown with authentication in these call flows. If authentication is not used, an imposter could "hijack" someone else's calls.

2.1.1 SIP Client New Registration

```
     User B                          SIP Server
       |                                |
       |          REGISTER F1           |
       |------------------------------->|
       |                                |
       |      401 Unauthorized F2       |
       |<-------------------------------|
       |                                |
       |          REGISTER F3           |
       |------------------------------->|
       |                                |
       |            200 OK F4           |
       |<-------------------------------|
       |                                |
```

User B initiates a new SIP session with the SIP Server (i.e. the user "logs on to" the SIP server). User B sends a SIP REGISTER request to the SIP server. The request includes the user's contact list. The SIP server provides a challenge to User B. User B enters her/his valid user ID and password. User B's SIP client encrypts the user information according to the challenge issued by the SIP server and sends the response to the SIP server. The SIP server validates the user's credentials. It registers the user in its contact database and returns a response (200 OK) to User B's SIP client. The response includes the user's current contact list in Contact headers. The format of the authentication shown is SIP digest as described by RFC 2543[2]. It is assumed that User B has not previously registered with this Server.

2.1.2 User updates contact list

```
User B                       SIP Server
  |                               |
  |          REGISTER F1          |
  |------------------------------>|
  |                               |
  |            200 OK F2          |
  |<------------------------------|
  |                               |
```

User B wishes to update the list of addresses where the SIP server will redirect or forward INVITE requests.

User B sends a SIP REGISTER request to the SIP server. User B's request includes an updated contact list. Since the user already has authenticated with the server, the user supplies authentication credentials with the request and is not challenged by the server. The SIP server validates the user's credentials. It registers the user in its contact database, updates the user's contact list, and returns a response (200 OK) to User B's SIP client. The response includes the user's current contact list in Contact headers.

```

2.1.3 User Requests Current Contact List

```
   User B                          SIP Server
     |                                |
     |          REGISTER F1           |
     |------------------------------->|
     |                                |
     |            200 OK F2           |
     |<-------------------------------|
     |                                |
```

User B sends a register request to the Proxy Server containing no Contact headers, indicating the user wishes to query the server for the user's current contact list. Since the user already has authenticated with the server, the user supplies authentication credentials with the request and is not challenged by the server. The SIP server validates the user's credentials. The server returns a response (200 OK) which includes the user's current registration list in Contact headers.

2.1.4 User Cancels Registration

```
User B                         SIP Server
  |                                |
  |          REGISTER F1           |
  |------------------------------->|
  |                                |
  |            200 OK F2           |
  |<-------------------------------|
  |                                |
```

User B wishes to cancel their registration with the SIP server. User B sends a SIP REGISTER request to the SIP server. The request has an expiration period of 0 and applies to all existing contact locations. Since the user already has authenticated with the server, the user supplies authentication credentials with the request and is not challenged by the server. The SIP server validates the user's credentials. It clears the user's contact list, and returns a response (200 OK) to User B's SIP client.

2.2 Failure Scenarios

2.2.1 Unsuccessful SIP registration

```
User B                        SIP Server
  |                               |
  |          REGISTER F1          |
  |------------------------------>|
  |                               |
  |      401 Unauthorized F2      |
  |<------------------------------|
  |                               |
  |          REGISTER F3          |
  |------------------------------>|
  |                               |
  |      401 Unauthorized F4      |
  |<------------------------------|
  |                               |
```

User B sends a SIP REGISTER request to the SIP Server. The SIP server provides a challenge to User B. User B enters her/his user ID and password. User B's SIP client encrypts the user information according to the challenge issued by the SIP server and sends the response to the SIP server. The SIP server attempts to validate the user's credentials, but they are not valid (the user's password does not match the password established for the user's account). The server returns a response (401 Unauthorized) to User B's SIP client.

3 SIP to SIP Dialing

3.1 Success Scenarios

This section details calls between two SIP User Agents (UAs): User A and User B. User A (LittleGuy sip:UserA@here.com) and User B (BigGuy sip:UserB@there.com) are assumed to be SIP phones or SIP-enabled devices. The successful calls show the initial signaling, the exchange of media information in the form of SDP payloads, the establishment of the media session, then finally the termination of the call.

SIP digest authentication is used by Proxy Servers to authenticate the caller User A. It is assumed that User B has registered with Proxy Server Proxy 2 as per Section 2.1 to be able to receive the calls via the Proxy.

3.1.1 Successful Simple SIP to SIP

```
   User A                      User B
```

```
   |                         |
   |       INVITE F1         |
   |------------------------>|
   |    (100 Trying) F2      |
   |<------------------------|
   |    180 Ringing F3       |
   |<------------------------|
   |                         |
   |       200 OK F4         |
   |<------------------------|
   |         ACK F5          |
   |------------------------>|
   |   Both Way RTP Media    |
   |<=======================>|
   |                         |
   |         BYE F6          |
   |<------------------------|
   |       200 OK F7         |
   |------------------------>|
   |                         |
```

In this scenario, User A completes a call to User B directly.

   |                |                |                |
```

In this scenario, User A completes a call to User B using two proxies Proxy 1 and Proxy 2. The initial INVITE (F1) does not contain the Authorization credentials Proxy 1 requires, so a 407 Proxy Authorization response is sent containing the challenge information. A new INVITE (F4) is then sent containing the correct credentials and the call proceeds. The call terminates when User B disconnects by initiating a BYE message.

Proxy 1 inserts a Record-Route header into the INVITE message to ensure that it is present in all subsequent message exchanges. Proxy 2 also inserts itself into the Record-Route header. The ACK (F15) and BYE (F18) both have a Route header.

A tag is inserted by User B in message F9 since the initial INVITE message contains more than one Via header and may have been forked.

 |           RTP Media Path             |
 |<====================================>|
```

In this scenario, User A completes a call to User B using two proxies Proxy 1 and Proxy 2. The initial INVITE (F1) does not contain the Authorization credentials Proxy 1 requires, so a 407 Proxy Authorization response is sent containing the challenge information. A new INVITE (F4) is then sent containing the correct credentials and the call proceeds after Proxy 2 challenges and receives valid credentials. The call terminates when User B disconnects by initiating a BYE message.

Proxy 1 inserts a Record-Route header into the INVITE message to

ensure that it is present in all subsequent message exchanges. Proxy 2 also inserts itself into the Record-Route header.

```

In this scenario, User A completes a call to User B via a Proxy Server. User A is configured for a primary SIP Proxy Server Proxy 1 and a secondary SIP Proxy Server Proxy 2 (Or is able to use DNS SRV records to locate Proxy 1 and Proxy 2). Proxy 1 is out of service and does not respond to INVITEs (it is reachable, but unresponsive). After sending a CANCEL to Proxy 1, User A then completes the call to User B using Proxy 2.

   |                |                |                |
```

User A completes a call to User B through a Firewall Proxy and a SIP Proxy. The signaling message exchange is identical to 3.1.1 but the media stream setup is not end-to-end - the Firewall proxy terminates both media streams and bridges them. This is done by the Proxy modifying the SDP in the INVITE (F1) and 200 OK (F10) messages, and possibly any 18x or ACK messages containing SDP.

In addition to firewall traversal, this Back-to-Back User Agent (B2BUA) could be used as part of an anonymizer service (in which all identifying information on User A would be removed), or to perform codec media conversion, such as mu-law to A-law conversion of PCM on an international call.

```

In this scenario, User A places a call to User B using first a Redirect server then a Proxy Server. The INVITE message is first sent to the Redirect Server. The Server returns a 302 Moved Temporarily response (F2) containing a Contact header with User B's current SIP address. User A then generates a new INVITE and sends to User B via the Proxy Server and the call proceeds normally. In this example, no SDP is present in the INVITE, so the SDP is carried in the ACK message.

The call is terminated when User B sends a BYE message.

```

This example shows a session whose media session changes twice during the session. The initial PCM media session is established between the two User Agents in messages F1 through F10. The called party then wishes to change the type of media session between them. (In this example, the called party detects a fax transmission and wishes to change the media session to a T.38 Fax over IP session). The called party then sends a re-INVITE in message F11 which is accepted in the 200 OK of message F13. After message F16, the original PCM media session is terminated and the new T.38 session established. After the fax transmission is over, the called party again wishes to switch the media session back to a PCM media session and initiates a re-INVITE sequence with message F17.

   |                |                |                |
```

In this scenario, User A gives up on the call before User B answers (sends a 200 OK response). User A sends a CANCEL (F9) since no final response had been received from User B. If a 200 OK to the INVITE had crossed with the CANCEL, User A would have sent an ACK then a BYE to User B in order to properly terminate the call.

Note that the CANCEL message is acknowledged with a 200 OK on a hop by hop basis, rather than end to end.

     |                |                |                |
```

In this scenario, User B is busy and sends a 486 Busy Here response to User A's INVITE. Note that the 4xx response is ACKed at each signaling leg.

   |                |                |                |
```

In this example, there is no response from User B to User A's INVITE messages being re-transmitted by Proxy 2. After the sixth re-transmission, Proxy 2 gives up and sends a CANCEL to User B and a 480 No Response to User A. Note that the CANCEL would also be retransmitted six times, as governed by SIP timer T1 as in Call Flow 5.2.6.

```

In this scenario, User B initially sends a 180 Ringing response to User A, indicating that alerting is taking place. However, then a 480 Unavailable is then sent to User A. This response is acknowledged then proxied back to User A.

4 SIP to Gateway Dialing

In the following scenarios, User A (BigGuy sip:UserA@here.com) is a SIP phone or other SIP-enabled device. User B is reachable via the PSTN at global telephone number +1-972-555-2222. User A places a call to User B through a Proxy Server Proxy 1 and a Network Gateway. In other scenarios, User A places calls to User C, who is served via a PBX (Private Branch Exchange) and is identified by a private extension 444-3333, or global number +1-918-555-3333. Note that User A uses his/her global telephone number +1-314-555-1111 in the From header in the INVITE messages. This then gives the Gateway the option of using this header to populate the calling party identification field in subsequent signaling (CgPN in ISUP). Left open is the issue of how the Gateway can determine the accuracy of the telephone number, necessary before passing it as a valid CgPN in the PSTN. Note that User A still uses his/her SIP URL in the Contact header, since the call could be redirected back to the SIP network.

There is a major difference in the call flows in this section. In-band alerting (ringing tone, busy tone, recorded announcements, etc.) is present in the PSTN speech path after the receipt of the SS7 Address Complete Message (ACM) which maps to the SIP 180 Ringing response. In a SIP to SIP call, the media path is not established until the call is answered (200 OK sent). In order for the SIP caller User A to hear this alerting, it is necessary that an early media path be established to perform this. This is the purpose of the 183 Session Progress responses used throughout this document in place of the 180 Ringing.

4.1 Success Scenarios

In these scenarios, User A is a SIP phone or other SIP-enabled device. User A places a call to User B in the PSTN or User C on a PBX through a Proxy Server Proxy 1 and a Gateway.

4.1.1 Successful SIP to ISUP PSTN call

```

User A dials the globalized E.164 number +1-972-555-2222 to reach User B. Note that A might have only dialed the last 7 digits, or some other dialing plan. It is assumed that the SIP User Agent Client converts the digits into a global number and puts them into a

SIP URL.

User A could use either their SIP address (sip:UserA@here.com) or SIP telephone number (sip:+1-314-555-1111@ss1.wcom.com;user=phone) in the From header. In this example, the telephone number is included, and it is shown as being passed as calling party identification through the Network Gateway (NGW 1) to User B (F5). Note that for this number to be passed into the SS7 network, it would have to be somehow

verified for accuracy.

In this scenario, User B answers the call then User A disconnects the call. Signaling between NGW 1 and User B's telephone switch is ANSI ISUP.

```

User A is a SIP device while User C is connected via an Enterprise Gateway (GW 1) to a PBX. The PBX connection is via a ISDN trunk group. User A dials User C's telephone number (918-555-3333) which is globalized and put into a SIP URL.

The host portion of the Request-URI in the INVITE F6 is used to identify the context (customer, trunk group, or line) in which the private number 444-3333 is valid. Otherwise, this INVITE message

could get forwarded by GW 1 and the context of the digits could become lost and the call unroutable.

Proxy 1 looks up the telephone number and locates the Enterprise Gateway that serves User C. User C is identified by its extension (444-3333) in the Request-URI sent to GW 1.

User A hears the ringing provided by the Gateway on the media path established after the 183 Session Progress response is received. Signaling between GW1 and PBX C is shown as ISDN.

```

User A calls User B through Proxy 1. Proxy 1 tries to route to a Network Gateway NGW 1. NGW 1 is not available and responds with a 503 Service Unavailable (F4). The call is then routed to Network Gateway NGW 2. User B answers the call. The call is terminated when User A disconnects the call. NGW 2 and User B's telephone switch use ANSI ISUP signaling.

4.2 Failure Scenarios

In these failure scenarios, the call does not complete. In most cases, however, a media stream is still setup. This is due to the fact that most failures in dialing to the PSTN result in in-band tones (busy, reorder tones or announcements - "The number you have dialed has changed. The new number is..."). The 183 Session Progress response containing SDP media information is used to setup this early media path so that the caller User A knows the final disposition of the call.

The media stream is either terminated by the caller after the tone or announcement has been heard and understood, or by the Gateway after a timer expires.

In other failure scenarios, a SS7 Release with Cause Code is mapped to a SIP response. In these scenarios, the early media path is not used, but the actual failure code is conveyed to the caller by the SIP User Agent Client.

4.2.1 Unsuccessful SIP to PSTN call: Treatment from PSTN

```

```

User A calls User B in the PSTN through a proxy server Proxy 1 and a Network Gateway NGW 1. The call is rejected by the PSTN with an in-band treatment (tone or recording) played. User A hears the treatment and then issues a CANCEL (F9) to terminate the call. (A BYE is not sent since no final response was ever received by User A.)

User A calls PSTN User B through a Proxy Server Proxy 1 and a Network Gateway NGW 1. However, User A does not provide enough digits for the call to be completed. The call is rejected by the PSTN with a ANSI ISUP Release message REL containing a specific Cause value. This cause value (28) is mapped by the Gateway to a SIP 484 Address Incomplete response which is proxied back to User A. For more details of ISUP cause value to SIP responses refer to [5].

User A calls User B in the PSTN through a proxy server Proxy 1 and Network Gateway NGW 1. The call is released by the Gateway after a timer expires due to no ANswer Message (ANM) being received. The Gateway sends an ISUP Release REL message to the PSTN and a 480 Temporarily Unavailable response to User A in the SIP network.

5 Gateway to SIP Dialing

5.1 Success Scenarios

In these scenarios, User A is placing calls from the PSTN to User B in a SIP network. User A's telephone switch signals to a Network Gateway (NGW 1) using ANSI ISUP.

Since the called SIP User Agent does not send in-band signaling information, no early media path needs to be established on the IP side. As a result, the 183 Session Progress response is not used. However, NGW 1 will establish a one way speech path prior to call completion, and generate ringing for the PSTN caller. Any tones or recordings are generated by NGW 1 and played in this speech path. When the call completes successfully, NGW 1 bridges the PSTN speech path with the IP media path. Alternatively, the Gateway could redirect the call to an Announcement Server which would complete the call and play announcements or tones as directed by the Gateway.

5.1.1 Successful PSTN to SIP call

```
   User A           NGW 1          Proxy 1          User B
```

```

   |<==============>|<===============================>|
   |    REL F13     |                |                |
   |--------------->|                |                |
   |    RLC F14     |                |                |
   |<---------------|    BYE F15     |                |
   |                |--------------->|    BYE F16     |
   |                |                |--------------->|
   |                |                |    200 F17     |
   |                |    200 F18     |<---------------|
   |                |<---------------|                |
   |                |                |                |
```

In this scenario, User A from the PSTN calls User B through a Network Gateway NGW1 and Proxy Server Proxy 1. When User B answers the call the media path is setup end-to-end. The call terminates when User A hangs up the call, with User A's telephone switch sending an ISUP RELease message which is mapped to a BYE by NGW 1.

```

This "fast answer" scenario is similar to 5.1.1 except that User B immediately accepts the call, sending a 200 OK (F5) without sending a 180 Ringing response. The Gateway then sends an Answer Message (ANM) without sending an Address Complete Message (ACM). Note that for ETSI and some other ISUP variants, a CONnect message (CON) would be sent instead of the ANM.

```

In this scenario, User A dials from PBX A to User B through GW 1 and Proxy 1. This is an example of a call that appears destined for the PSTN but instead is routed to a SIP Client.

Signaling between PBX A and GW 1 is Feature Group B (FGB) circuit associated signaling, in-band Mult-Frequency (MF) outpulsing. After the receipt of the 180 Ringing from User B, GW 1 generates ringing tone for User A.

User B answers the call by sending a 200 OK. The call terminates when User A hangs up, causing GW1 to send a BYE.

The Enterprise Gateway can only identify the trunk group that the call came in on, it cannot identify the individual line on PBX A that

is placing the call. The SIP URL used to identify the caller is shown in these flows as sip:IdentifierString@gw1.wcom.com. A unique IdentifierString is provisioned on the Gateway against each incoming trunk group. Note: the string could be a telephone number.

```

In this scenario, User A calls User B through Network Gateway NGW 1 and Proxy 1. The call is routed to User B by Proxy 1. The call is rejected by User B who sends a 600 Busy Everywhere response. The Gateway sends a REL message containing a specific Cause value mapped by the gateway based on the SIP error.

Since no interworking is indicated in the IAM (F1), the busy tone is generated locally by User A's telephone switch. In scenario 5.2.3, the busy signal is generated by the Gateway since interworking is indicated. For more discussion on interworking, refer to [5].

   |                |               |               |
```

In this scenario, User A calls User B through Network Gateway NGW1 and Proxy 1. The call is routed to User B by Proxy 1. The call is rejected by the User B client. NGW 1 sets up a two way voice path to User A, plays busy tone, and releases call after timeout.

NGW 1 plays the busy tone since the IAM (F1) indicates the interworking is present. In scenario 5.2.2, with no interworking, the busy indication is carried in the REL Cause value and is generated locally instead.

Again, note that for ETSI or ITU ISUP, a CONnect message would be sent instead of the Answer Message.

```

User A calls User B through NGW 1 and Proxy 1. Proxy 1 re-sends the INVITE after the expiration of SIP timer T1 without receiving any response from User B. User B never responds with 180 Ringing or any other response (it is reachable but unresponsive). After the expiration of a timer, User A's network disconnects the call by sending a Release message REL. The Gateway maps this to a CANCEL which is again re-sent by Proxy 1 after SIP T1 timer expires.

  |                 |                |                |
```

In this scenario, User A calls User B through NGW 1 and Proxy 1. Since Proxy 1 is stateless (it does not send a 100 Trying response), NGW 1 re-sends the INVITE and CANCEL messages after the expiration of SIP timer T1. User B does not respond with 180 Ringing. User A's network disconnects the call with a release REL (CauseCode=102 Timeout).

```

In this scenario, User A calls User B through NGW 1 and Proxy 1. User B does not respond with 200 OK. NGW 1 plays ringing tone since the ACM indicates that interworking has been encountered. User A disconnects the call with a Release message REL which is mapped by NGW 1 to a CANCEL. Note that if User B had sent a 200 OK response after the REL, NGW 1 would have sent an ACK then a BYE to properly terminate the call.

6 Gateway to Gateway Dialing via SIP Network

In these scenarios, both the caller and the called party are in the telephone network, either normal PSTN subscribers or PBX extensions. The calls route through two Gateways and at least one SIP Proxy Server. The Proxy Server performs the authentication and location of the Gateways.

Again it is noted that the intent of this call flows document is not to provide a detailed parameter level mapping of SIP to PSTN protocols. For information on SIP to ISUP mapping, the reader is referred to other references [5].

6.1 Success Scenarios

In these scenarios, the call is successfully completed between the two Gateways allowing the PSTN or PBX users to communicate. The 183 Session Progress response is used to indicate in-band alerting may flow from the called party telephone switch to the caller.

6.1.1 Successful ISUP PSTN to ISUP PSTN call

```

In this scenario, User A in the PSTN calls User C who is an extension on a PBX. User A's telephone switch signals via SS7 to the Network Gateway NGW 1, while User C's PBX signals via SS7 with the Enterprise Gateway GW 2. The CdPN and CgPN are mapped by GW1 into SIP URLs and placed in the To and From headers. Proxy 1 looks up the dialed digits in the Request-URI and maps the digits to the PBX extension of User C

served by GW 2. The Request-URI in F3 uses the host portion of the Request-URI to identify what private dialing plan is being referenced. The INVITE is then forwarded to GW 2 for call completion.

An early media path is established end-to-end so that User A can hear the ringing tone generated by PBX C.

User C answers the call and the media path is cut through in both directions. User B hangs up terminating the call.

```

PBX User A calls PBX User C via Gateway GW 1 and Proxy 1. During the attempt to reach User C via GW 2, an error is encountered - Proxy 1 receives a 503 Service Unavailable (F4) response to the forwarded INVITE. This could be due to all circuits being busy, or some other outage at GW 2. Proxy 1 recognizes the error and uses an alternative route via GW 3 to terminate the call. From there, the call proceeds normally with User C answering the call. The call is terminated when User C hangs up.

7 SIP Test Messages

The files in here are test messages for SIP servers to exercise various functions. They have been used in SIP "bakeoff" interoperablity events. All messages shown here are valid, unless otherwise noted. The correct behavior of servers and clients is also described.

7.1 INVITE Parser Torture Test Message

This message is a correctly formatting SIP message. It contains:

line folding all over
escaped characters within quotes
LWS between colons, semicolons, headers, and other fields
both comma separated and separate listing of headers
mix or short and long form for the same header
unknown header field
unusual header ordering
nested comments
unknown parameters of a known header

Proxies should forward message and clients should respond as to a normal INVITE message.

Message Details

7.2 INVITE with Proxy-Require and Require

This message tests support for Proxy-Require and Require. It is a request that contains both headers, listing new features.

Proxies and clients should respond with a 420 Bad Extension, and an Unsupported header listing these features.

7.3 INVITE with Unknown Schemes in URIs and URLs

This message contains unknown schemes in the Request URI, To, From and Contact headers of a request.

A server should probably return a not found error; but other behaviors are acceptable.

Message Details

```
INVITE name:John_Smith SIP/2.0
```

```

7.4 REGISTER with Y2038 Test

This message is a registration request with an expiration year of 2040. This makes sure that a server doesn't crash on seeing a date past Y2038.

The correct behavior is probably to limit the lifetime to some configured maximum.

Message Details

```
REGISTER sip:company.com SIP/2.0
To: sip:user@company.com
From: sip:user@company.com
Contact: sip:user@host.company.com

Content-Type: application/newformat

<audio>
```

```
 <pcmu port="443"/>
</audio>
```

7.7 Unknown Method Message

This request message contains a new unknown method, NEWMETHOD.

A proxy should forward this using the same retransmission rules as BYE. A UAS should reject it with an error, and list the available methods in the response.

Message Details

```
NEWMETHOD sip:user@comapny.com SIP/2.0
To: sip:j.user@company.com
From: sip:caller@university.edu
Call-ID: 0ha0isndaksdj@10.0.0.1
CSeq: 8 NEWMETHOD

```

```
m=video 3227 RTP/AVP 31
a=rtpmap:31 LPC
```

7.8 Unknown Method with CSeq Error

This message is nearly identical to the Unknown Method message. It is a request with a new unknown method, but with a CSeq method tag which does not match.

A proxy should either respond with an error, or correct the method tag. The user agent should reject it with an error, and list the available methods in the response.

Message Details

```
NEWMETHOD sip:user@comapny.com SIP/2.0
To: sip:j.user@company.com
From: sip:caller@university.edu
Call-ID: 0ha0isndaksdj@10.0.1.1

```

7.14 200 OK Response with Broadcast Via Header

This message is a response with a 2nd Via header of 255.255.255.255.

On receiving this response, the top Via header is stripped and the packet forwarded. Since the next address is the broadcast address, it causes the packet to be broadcast onto the network. A smart server should ignore packets with 2nd Via headers that are 255.255.255.255 or 127.0.0.1. At the very least it should not crash.

Message Details

```
SIP/2.0 200 OK

7.31 INVITE with Max-Forwards Set to Zero

This is a legal SIP request with the Max-Forwards header set to zero.

A proxy or gateway should not forward the request and respond 483 (Too Many Hops).

Message Details

```
INVITE sip:user@company.com SIP/2.0
To: sip:user@company.com
From: sip:caller@university.edu
Call-ID: 9@10.0.0.1
CSeq: 1 INVITE
Via: SIP/2.0/UDP 135.180.130.133
Max-Forwards: 0
Content-Type: application/sdp
Content-Length: 174

```

7.32 REGISTER with a Escaped Header in a Legal SIP URL of a Contact

This is a legal REGISTER message where the Contact header contains a SIP URL with an escaped header within it.

Message Details

```
REGISTER sip:company.com SIP/2.0
To: sip:user@company.com
From: sip:user@company.com
Contact: sip:user@host.company.com
Call-ID: k345asrl3fdbv@10.0.0.1
CSeq: 1 REGISTER
Via: SIP/2.0/UDP 135.180.130.133
Contact: <sip:user@example.com?Route=%3Csip:sip.example.com%3E>
```

7.33 REGISTER with a Escaped Header in a Illegal SIP URL of a Contact

This is an illegal message as the REGISTER request contains a SIP

URL with an escaped header but it is not enclosed in <>

A server should respond 400 with an appropriate reason phrase.

Message Details

```
REGISTER sip:company.com SIP/2.0
To: sip:user@company.com
From: sip:user@company.com
Contact: sip:user@host.company.com
Call-ID: k345asrl3fdbv@10.0.0.1
CSeq: 1 REGISTER
Via: SIP/2.0/UDP 135.180.130.133
Contact: sip:user@example.com?Route=%3Csip:sip.example.com%3E
```

7.34 INVITE with Long Values in Headers

This is a legal message that contains long values in many headers.

Message Details

```

```

7.37 REGISTER with a contact parameter.

This REGISTER contains a contact where the 'user' parameter should be interpreted
as being a contact-param and not a url-param.

The register should succeed but a subsequent retrieval of the registration must not
include "user=phone" as a url-parameter.

Message Details

```
REGISTER sip:bell-tel.com SIP/2.0
Via: SIP/2.0/UDP saturn.bell-tel.com
From: sip:watson@bell-tel.com
To: sip:watson@bell-tel.com
Call-ID: 70710@saturn.bell-tel.com
CSeq: 2 REGISTER
Contact: sip:+1-972-555-2222@gw1.wcom.com;user=phone
```

7.38 REGISTER with a url parameter.

This register contains a contact where the 'user'parameter is a url-param.

The register should succeed and a subsequent retrieval of the registration must
include "user=phone" as a url-parameter.

Message Details

```
REGISTER sip:bell-tel.com SIP/2.0
Via: SIP/2.0/UDP saturn.bell-tel.com
From: sip:watson@bell-tel.com
To: sip:watson@bell-tel.com
Call-ID: 70710@saturn.bell-tel.com
CSeq: 3 REGISTER
Contact: <sip:+1-972-555-2222@gw1.wcom.com;user=phone>
```

7.39 INVITE with an Unquoted Display Name Containing Multiple Tokens

This is a legal INVITE where the To and From header contain display names
that contain multiple tokens but are unquoted,

Message Details

```
INVITE sip:t.watson@ieee.org SIP/2.0
Via:     SIP/2.0/UDP c.bell-tel.com
From:    A. Bell <sip:a.g.bell@bell-tel.com>
To:      T. Watson <sip:t.watson@ieee.org>
```

```
Call-ID: 31414@c.bell-tel.com
CSeq:    1 INVITE
```

7.40 INVITE with an Unquoted Display Name Containg Non-Token Characters

This is an illegal invite at the display names in the To and From headers
contain non-token characters but are unquoted.

A server may be intelligent enough to cope with this but may also return a
400 response with an appropriate reason phrase.

Message Details

```
INVITE sip:t.watson@ieee.org SIP/2.0
Via:     SIP/2.0/UDP c.bell-tel.com
From:    Bell, Alexander <sip:a.g.bell@bell-tel.com>
To:      Watson, Thomas <sip:t.watson@ieee.org>
Call-ID: 31415@c.bell-tel.com
CSeq:    1 INVITE
```

7.41 INVITE with Unknown (Higher) Protocol Version in Start Line

This is an illegal INVITE as the SIP Protocol version is unknown.

The server should respond to the request with a bad version error.

Message Details

```
INVITE sip:t.watson@ieee.org SIP/7.0
Via:     SIP/2.0/UDP c.bell-tel.com
From:    A. Bell <sip:a.g.bell@bell-tel.com>
To:      T. Watson <sip:t.watson@ieee.org>
Call-ID: 31417@c.bell-tel.com
CSeq:    1 INVITE
```

8 Acknowledgements

The authors wish to thank Neil Deason for his additions to the Torture Test messages and Kundan Singh for performing parser validation of messages.

The authors wish to thank the following individuals for their participation in the final review of this call flows document: Aseem Agarwal, Rafi Assadi, Ben Campbell, Sunitha Kumar, Jon Peterson, Marc Petit-Huguenin, Vidhi Rastogi, and Bodgey Yin Shaohua.

The authors also wish to thank the following individuals for their assistance: Jean-Francois Mule, Hemant Agrawal, Henry Sinnreich, David Devanatham, Joe Pizzimenti, Matt Cannon, John Hearty, the whole MCI WorldCom IPOP Design team, Scott Orton, Greg Osterhout, Pat Sollee, Doug Weisenberg, Danny Mistry, Steve McKinnon, and Denise Ingram, Denise Caballero, Tom Redman, Ilya Slain, Pat Sollee, John Truetken, and others from MCI WorldCom, 3Com, Cisco, Lucent and Nortel.
